Four-plant database: technical readability is different from scientific readiness

Plant / task	Readable numeric records	Independent identity / units	Scientific use now
Acid jujube (primary)	855 declared samples; 4 paired representations	User declaration; 1 lot per group; units/logs incomplete	EXPLORATORY internal 5/2-fold
Huangqi (auxiliary)	403 declared independent records; n only 303	User declaration; origins/batches/units not authenticated	EXPLORATORY 4 source groups; transfer BLOCKED
Tianma (auxiliary)	405 declared independent records; time only 202	User declaration; origins/batches/units not authenticated	EXPLORATORY 4 source groups; transfer BLOCKED
Wheat (auxiliary)	12/12/13/13 averaged curves; not 50 independent samples	Quantity, averaging parents and labels unknown	BLOCKED classification/regression
Confirmation cohort	No qualifying new independent batch	MISSING	No external confirmation accuracy
Molecular mechanism	3 candidate preparations; water software test only	Candidate optimized geometry / frequency / IR NOT_RUN	No Gaussian/DFT peak prior in models

Representations are not separate biological samples or independent sensors. Equal numeric axes do not establish physical compatibility.
Later user declaration permits HQ/Tianma source-group tasks; named-origin/batch confirmation and cross-plant transfer remain unresolved.
