Acid jujube kernel main task
855 declared-independent specimens, 7 anonymous groups
One source batch per origin; no pristine confirmation set

Fixed data + original 5 outer / 2 inner folds
Source-only preprocessing, selection and tuning

CORE: about 70% of planned effort
MC-UVE + SVM optimization / ablations
Fair SVM, shrinkage LDA and MLP comparison

Freeze each outer fold's inner choices
Then score outer predictions; preserve negative results

855 OOF accuracy, Macro-F1, balanced accuracy
Class errors, frequency stability and measured cost

AUXILIARY: about 20%
Separate Huangqi / ginseng / plant THz tasks
No mixing of plant labels into jujube origin labels

Separate 513 / 171 / 171 protocol
1-shot conservative calibration + zero-label controls
Retrospective within-batch only

Sample identity, labels, license
and physical-axis compatibility verified?

No

Yes; not yet established

Currently blocked where evidence is missing
No invented samples or transfer results

AUXILIARY: about 10% transfer + calibration
A: jujube only; B: other-plant pretraining
C: multi-plant pretraining; same jujube evaluation

Future independent new batches
External confirmation + real cross-batch calibration
