Four-plant database: technical readability is different from scientific readiness

Plant / task	Readable numeric records	Independent identity / units	Scientific use now
Acid jujube (primary)	855declared samples;4paired representations	Userdeclaration;1lot per group; units/logs incomplete	EXPLORATORY internal5/2-fold
Huangqi (auxiliary)	403declared independent records; n only303	Userdeclaration; origins/batches/units notauthenticat	EXPLORATORY4source groups; transfer BLOCKED
Tianma (auxiliary)	405declared independent records; time only2(	Userdeclaration; origins/batches/units notauthenticat	EXPLORATORY4source groups; transfer BLOCKED
Wheat (auxiliary)	12/12/13/13averaged curves; not50independe	Quantity, averaging parents and labels unknown	BLOCKED classification/regression
Confirmation cohort	No qualifying new independent batch	MISSING	No external confirmation accuracy
Molecular mechanism	3candidate preparations; water software test (	Candidate optimizedgeometry /freq /IR NOT_RUN	No Gaussian/DFT peak prior in models

Representations are not separate biological samples or independent sensors. Numeric axis equality does not establish physical compatibility.
Later userdeclaration permits HQ/Tianma internal source-group tasks; true named-origin/batch confirmation and cross-plant transfer remain unresolved.
